

# Easit's implementation model

## – makes it easy to get started

### 1. Kick-off meeting & project plan

Together with the customer, we establish a project plan where we decide on activities, responsibilities and also establish a time-plan. A technical checklist is made for the platform and ongoing technical support.

### 2. Installation and Configuration

Installation and configuration of the system are made either on-site or via remote installation.

### 3. Workshop

We conduct a joint workshop that will form the basis of how systems and work procedures will be adapted to each other.

### 6. Verification Period

During a verification period, you test the system to ensure that everything we established during the workshop works as expected.

### 5. Education

We make sure that everyone, both managers and system administrators, receive the necessary training. System administrators have a more in-depth training.

### 4. Project meetings

We set up regular project meetings where we go through the timeplan and other issues that come up along the way.

### 7. Start of production

Now it's time for the production launch of the system. We are of course available to provide the support required.

### 8. Evaluation

We at Easit are always striving to improve and we always evaluate our introductions together with the customer.

### 9. Support

We are always available and ready for our customers' questions via our support. You also maintain contact with the team from Easit who worked with the actual introduction.
